

ABSTRACT OF THE INVENTION

An aromatic apparatus for use with plumbing fixtures such as shower heads and pipes that carry warm or hot fluid, such as water. The aromatic apparatus includes an aromatic component that is configured to be disposed at least partially around a tubular member associated with the plumbing fixture and to emanate a desired aroma when warm or hot fluid flows through the tubular member. The aromatic component can be a solid or semi-solid material, such as silicone, that is impregnated or coated with a volatile fragrance. The aromatic component can also be in the form of gelled beads, crystals or a liquid. The shower head configuration includes a chamber for holding the aromatic component and one or more openings for allowing the aroma to emanate from the shower head. The pipe configuration includes a closure mechanism or a snap-on clip member for securing the aromatic component to the pipe.
